

MRC HNR Welcomes World Cancer Research Fund Report

On the 26th February 2009, the WCRF launched their Policy and Action for Cancer Prevention. We welcome the recognition of the importance of dietary factors in the prevention of cancer and concur with the need for all sections of society to take action to support and facilitate dietary change. At HNR we recognize that improvements need an evidence base and effective communication.

Importantly the report recognizes that this dietary strategy is consistent with a reduction in deaths from other diseases too and we will continue research at HNR to develop the evidence base for action across with breadth of public health nutrition. We also see to extend nutrition strategies within the broader goals for food policy.

The report is available to download at:
